

复变函数与数理方程作业题答案

数学科学系 吴昊

2020 年秋季

1 复变函数与积分变换

1.1 第 01 次课作业

本次课程不安排作业。

1.2 第 02 次课作业

习题 1.1 下列式子在复平面上具有怎样的意义? (并给出具体过程)

$$(1) |z - a| = |z - b| \quad (a, b \text{ 为复常数}), \quad (2) |z| + \operatorname{Re} z \leq 1, \\ (3) \operatorname{Re} \left(\frac{1}{z} \right) = 2, \quad (4) \left| \frac{z-1}{z+1} \right| = 2, \quad (5) \arg(z - i) = \frac{\pi}{4}.$$

解: (1) 设

$$z = x + iy, \quad a = a_1 + ia_2, \quad b = b_1 + ib_2,$$

其中 $x, y, a_1, a_2, b_1, b_2 \in \mathbb{R}$. 原方程等价于

$$(x - a_1)^2 + (y - a_2)^2 = (x - b_1)^2 + (y - b_2)^2,$$

整理得

$$(a_1 - b_1) \left(x - \frac{a_1 + b_1}{2} \right) + (a_2 - b_2) \left(y - \frac{a_2 + b_2}{2} \right) = 0.$$

因此原方程在复平面是一条经过 a, b 线段中点且与该线段垂直的直线。

(2) 设

$$z = x + iy, \quad x, y \in \mathbb{R}.$$

代入原等式得

$$\sqrt{x^2 + y^2} + x \leq 1,$$

整理得

$$y^2 \leq -2 \left(x - \frac{1}{2} \right).$$

因此原方程在复平面是开口向左、顶点在 $(\frac{1}{2}, 0)$ 的抛物线及其包围区域内部。

(3) 设

$$z = x + iy, \quad x, y \in \mathbb{R}.$$

由于

$$\frac{1}{z} = \frac{1}{x + iy} = \frac{x - iy}{x^2 + y^2},$$

原方程为

$$\frac{x}{x^2 + y^2} = 2 \iff \left(x - \frac{1}{4} \right)^2 + y^2 = \frac{1}{16}, \quad x^2 + y^2 \neq 0.$$

因此原方程在复平面是以 $(\frac{1}{4}, 0)$ 为圆心、 $\frac{1}{4}$ 为半径且挖去原点的圆。

(4) 设

$$z = x + iy, \quad x, y \in \mathbb{R}.$$

代入原式得

$$\sqrt{(x-1)^2 + y^2} = 2\sqrt{(x+1)^2 + y^2}, \quad (x+1)^2 + y^2 \neq 0,$$

整理得到

$$\left(x + \frac{5}{3} \right)^2 + y^2 = \frac{16}{9}.$$

因此原方程在复平面是以 $(-\frac{5}{3}, 0)$ 为圆心、 $\frac{4}{3}$ 为半径的圆。

(5) 设

$$z = x + iy, \quad x, y \in \mathbb{R}.$$

原式即

$$\arg(x + i(y-1)) = \frac{\pi}{4} \iff \frac{y-1}{x} = \tan \frac{\pi}{4} = 1, \quad x > 0.$$

故原方程在复平面是以 $(0, 1)$ 为端点向右上方的一条射线（不包括端点）。□

习题 1.2 计算下列数值 (a, b, φ 为实常数)

$$(1) (1+i)^i, \quad (2) \cos \varphi + \cos 2\varphi + \cdots + \cos n\varphi, \quad (3) \sin(a+ib).$$

解: (1) 我们有

$$(1+i)^i = e^{i \ln(1+i)} = e^{i(\ln \sqrt{2} + i(\frac{\pi}{4} + 2k\pi))} = e^{-\frac{\pi}{4} - 2k\pi} \left(\cos(\ln \sqrt{2}) + i \sin(\ln \sqrt{2}) \right).$$

其中 $k \in \mathbb{Z}$ 。

(2) 我们有

$$\begin{aligned}\sum_{k=1}^n \cos k\varphi &= \sum_{k=1}^n \frac{e^{ik\varphi} + e^{-ik\varphi}}{2} = \frac{e^{i\varphi} - e^{i(n+1)\varphi}}{2(1 - e^{i\varphi})} + \frac{e^{-i\varphi} - e^{-i(n+1)\varphi}}{2(1 - e^{-i\varphi})} \\ &= \frac{1}{2} \left(\frac{e^{i(n+\frac{1}{2})\varphi} - e^{\frac{1}{2}i\varphi}}{e^{\frac{1}{2}i\varphi} - e^{-\frac{1}{2}i\varphi}} + \frac{e^{-\frac{1}{2}i\varphi} - e^{-i(n+\frac{1}{2})\varphi}}{e^{\frac{1}{2}i\varphi} - e^{-\frac{1}{2}i\varphi}} \right) = -\frac{1}{2} + \frac{1}{2} \frac{e^{i(n+\frac{1}{2})\varphi} - e^{-i(n+\frac{1}{2})\varphi}}{e^{i\frac{\varphi}{2}} - e^{-i\frac{\varphi}{2}}} \\ &= -\frac{1}{2} + \frac{\sin(n + \frac{1}{2})\varphi}{2 \sin \frac{\varphi}{2}}.\end{aligned}$$

(3) 我们有

$$\sin(a + ib) = \frac{e^{i(a+ib)} - e^{-i(a+ib)}}{2i} = \frac{i}{2} (e^b e^{-ia} - e^{-b} e^{ia}) = \frac{1}{2} (e^b + e^{-b}) \sin a + \frac{i}{2} (e^b - e^{-b}) \cos a. \quad \square$$

习题 1.3 试证明 $\overline{e^z} = e^{\bar{z}}$.

证明: 设

$$z = x + iy, \quad x, y \in \mathbb{R}.$$

则有

$$\overline{e^z} = \overline{e^{x+iy}} = \overline{e^x(\cos y + i \sin y)} = e^x(\cos y - i \sin y) = e^{x-iy} = e^{\bar{z}}. \quad \square$$

习题 1.4

(1) 用复变量表示过点 $1 + 3i$ 和 $-1 + 4i$ 直线的方程;

(2) 设 $A, C \in \mathbb{R}$, $B \in \mathbb{C}$, 问方程 $Azz^* + Bz^* + B^*z + C = 0$ 在什么条件是圆方程, 并求其圆心和半径。

解: (1) 经过 $(1, 3)$ 和 $(-1, 4)$ 的直线方程为

$$x + 2y - 7 = 0.$$

令

$$x = \frac{1}{2}(z + z^*), \quad y = \frac{1}{2i}(z - z^*),$$

代入上式, 则有

$$\left(\frac{1}{2} - i\right)z + \left(\frac{1}{2} + i\right)z^* - 7 = 0.$$

(2) 设

$$z = x + iy, \quad B = b_1 + ib_2.$$

其中 $x, y, b_1, b_2 \in \mathbb{R}$. 首先 $A \neq 0$, 否则原方程为直线方程. 将上式代入原方程, 可得

$$\left(x + \frac{b_1}{A}\right)^2 + \left(y + \frac{b_2}{A}\right)^2 = \frac{b_1^2 + b_2^2 - AC}{A^2}.$$

因此原方程为圆方程的充要条件为

$$A \neq 0, \quad BB^* - AC > 0,$$

且圆心为 $-\frac{B}{A}$, 半径为 $\frac{\sqrt{BB^* - AC}}{|A|}$. $\square$

习题 1.5 设 $f(z) = u(r, \varphi) + i v(r, \varphi)$ ($z = r e^{i\varphi}$), 试推导出极坐标下的 $C-R$ 条件, 并证明

$$f'(z) = \frac{r}{z} \left(\frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right).$$

解: 我们有极坐标和直角坐标间的变换关系

$$\begin{aligned} x &= r \cos \varphi, \quad y = r \sin \varphi, \\ r &= \sqrt{x^2 + y^2}, \quad \varphi = \arctan \frac{y}{x}. \end{aligned}$$

因此有

$$\begin{aligned} \frac{\partial r}{\partial x} &= \frac{x}{\sqrt{x^2 + y^2}} = \frac{x}{r} = \cos \varphi, & \frac{\partial r}{\partial y} &= \frac{y}{\sqrt{x^2 + y^2}} = \frac{y}{r} = \sin \varphi \\ \frac{\partial \varphi}{\partial x} &= \frac{-\frac{y}{x^2}}{1 + \left(\frac{y}{x}\right)^2} = \frac{-y}{r^2} = -\frac{\sin \varphi}{r}, & \frac{\partial \varphi}{\partial y} &= \frac{\frac{1}{x}}{1 + \left(\frac{y}{x}\right)^2} = \frac{x}{r^2} = \frac{\cos \varphi}{r}. \end{aligned}$$

根据链式法则

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{\partial u}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial u}{\partial \varphi} \frac{\partial \varphi}{\partial x} = \cos \varphi \frac{\partial u}{\partial r} - \frac{\sin \varphi}{r} \frac{\partial u}{\partial \varphi}, & \frac{\partial u}{\partial y} &= \frac{\partial u}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial u}{\partial \varphi} \frac{\partial \varphi}{\partial y} = \sin \varphi \frac{\partial u}{\partial r} + \frac{\cos \varphi}{r} \frac{\partial u}{\partial \varphi}, \\ \frac{\partial v}{\partial x} &= \frac{\partial v}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial v}{\partial \varphi} \frac{\partial \varphi}{\partial x} = \cos \varphi \frac{\partial v}{\partial r} - \frac{\sin \varphi}{r} \frac{\partial v}{\partial \varphi}, & \frac{\partial v}{\partial y} &= \frac{\partial v}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial v}{\partial \varphi} \frac{\partial \varphi}{\partial y} = \sin \varphi \frac{\partial v}{\partial r} + \frac{\cos \varphi}{r} \frac{\partial v}{\partial \varphi}. \end{aligned}$$

将它们代入直角坐标系中的 $C-R$ 条件

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y},$$

可得

$$\cos \varphi \frac{\partial u}{\partial r} - \frac{\sin \varphi}{r} \frac{\partial u}{\partial \varphi} = \sin \varphi \frac{\partial v}{\partial r} + \frac{\cos \varphi}{r} \frac{\partial v}{\partial \varphi}, \quad (1.1)$$

$$\sin \varphi \frac{\partial u}{\partial r} + \frac{\cos \varphi}{r} \frac{\partial u}{\partial \varphi} = -\cos \varphi \frac{\partial v}{\partial r} + \frac{\sin \varphi}{r} \frac{\partial v}{\partial \varphi}. \quad (1.2)$$

考虑 $(1.1) \times \cos \varphi + (1.2) \times \sin \varphi$ 和 $(1.1) \times \sin \varphi - (1.2) \times \cos \varphi$ 得到极坐标系下的 $C-R$ 条件

$$\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \varphi}, \quad \frac{\partial u}{\partial \varphi} = -r \frac{\partial v}{\partial r}.$$

进一步的, 我们有

$$\begin{aligned} f'(z) &= \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = \left(\cos \varphi \frac{\partial u}{\partial r} - \frac{\sin \varphi}{r} \frac{\partial u}{\partial \varphi} \right) + i \left(\cos \varphi \frac{\partial v}{\partial r} - \frac{\sin \varphi}{r} \frac{\partial v}{\partial \varphi} \right) \\ &= \left(\cos \varphi \frac{\partial u}{\partial r} + \sin \varphi \frac{\partial v}{\partial r} \right) + i \left(\cos \varphi \frac{\partial v}{\partial r} - \sin \varphi \frac{\partial u}{\partial r} \right) = \frac{r}{z} \left(\frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right). \quad \square \end{aligned}$$

习题 1.6 判断下列函数的可微性及解析性

$$(1) f(z) = xy^2 + ix^2y, \quad (2) f(z) = 2x^3 + i3y^3.$$

解: (1) 设 $f(z) = u + iv$, 其中

$$u(x, y) = xy^2, \quad v(x, y) = x^2y.$$

可知 u, v 在整个复平面上连续可微, 进一步的, 根据 $C-R$ 条件

$$\frac{\partial u}{\partial x} = y^2 \neq x^2 = \frac{\partial v}{\partial y}, \quad \frac{\partial v}{\partial x} = 2xy \neq -2xy = -\frac{\partial u}{\partial y},$$

当且仅当 $x = y = 0$ 等号成立, 因此 $f(z)$ 只在原点处可微, 并且在复平面任一点不解析。

(2) 令

$$u(x, y) = 2x^3, \quad v(x, y) = 3y^3.$$

可知 u, v 在整个复平面上连续可微, 进一步的, 根据 $C-R$ 条件

$$\frac{\partial u}{\partial x} = 6x^2 \neq 9y^2 = \frac{\partial v}{\partial y}, \quad \frac{\partial v}{\partial x} = 0 \neq -\frac{\partial u}{\partial y},$$

当且仅当 $y = \pm \frac{\sqrt{6}}{3}x$ 等号成立, 因此 $f(z)$ 只在直线 $y = \frac{\sqrt{6}}{3}x$ 和 $y = -\frac{\sqrt{6}}{3}x$ 上可微, 并且在复平面任一点不解析。□

习题 1.7 已知解析函数 $f(z)$ 的实部 $u(x, y)$ 或虚部 $v(x, y)$, 求该解析函数

$$(1) u = e^x \sin y, \quad (2) u = \frac{x^2 - y^2}{(x^2 + y^2)^2}, \quad f(\infty) = 0, \quad (3) u = \ln \rho, \quad f(1) = 0.$$

解: (1) 首先有

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = e^x \sin y - e^x \sin y = 0,$$

利用 $C-R$ 条件, 虚部 $v(x, y)$ 的偏导数满足

$$\frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y} = -e^x \cos y, \quad \frac{\partial v}{\partial y} = \frac{\partial u}{\partial x} = e^x \sin y.$$

由此给出 $v(x, y)$ 的全微分

$$dv = -e^x \cos y dx + e^x \sin y dy = d(-e^x \cos y),$$

因此

$$v(x, y) = -e^x \cos y + C.$$

这里 $C \in \mathbb{R}$ 为任意常数, 从而有

$$f(z) = e^x \sin y - ie^x \cos y + iC = -ie^z + iC.$$

(2) 将实部 $u(x, y)$ 写成极坐标下的形式

$$u(\rho, \varphi) = \frac{\cos 2\varphi}{\rho^2},$$

在极坐标下 $u(\rho, \varphi)$ 满足

$$\frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial u}{\partial \rho} \right) + \frac{1}{\rho^2} \frac{\partial^2 u}{\partial \varphi^2} = 4\rho^{-4} \cos 2\varphi - 4\rho^{-4} \cos 2\varphi = 0.$$

是调和函数。利用 $C-R$ 条件, 虚部 $v(\rho, \varphi)$ 的偏导数满足

$$\frac{\partial v}{\partial \varphi} = \rho \frac{\partial u}{\partial \rho} = -2\rho^{-2} \cos 2\varphi, \quad \frac{\partial v}{\partial \rho} = -\rho^{-1} \frac{\partial u}{\partial \varphi} = 2\rho^{-3} \sin 2\varphi.$$

由此给出 $v(\rho, \varphi)$ 的全微分

$$dv = 2\rho^{-3} \sin 2\varphi d\rho - 2\rho^{-2} \cos 2\varphi d\varphi = d\left(-\frac{\sin 2\varphi}{\rho^2}\right),$$

因此

$$v = -\frac{\sin 2\varphi}{\rho^2} + C,$$

这里 $C \in \mathbb{R}$ 为任意常数, 从而有

$$f(z) = \frac{\cos 2\varphi}{\rho^2} - i \frac{\sin 2\varphi}{\rho^2} + iC = \frac{1}{z^2} + iC.$$

再根据条件 $f(\infty) = 0$, 可得 $C = 0$, 因此

$$f(z) = \frac{1}{z^2}.$$

(3) 在极坐标下 $u(\rho, \varphi)$ 满足

$$\frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial u}{\partial \rho} \right) + \frac{1}{\rho^2} \frac{\partial^2 u}{\partial \varphi^2} = 0.$$

是调和函数。利用 $C-R$ 条件, 虚部 $v(\rho, \varphi)$ 的偏导数满足

$$\frac{\partial v}{\partial \varphi} = \rho \frac{\partial u}{\partial \rho} = 1, \quad \frac{\partial v}{\partial \rho} = -\rho^{-1} \frac{\partial u}{\partial \varphi} = 0.$$

由此给出 $v(\rho, \varphi)$ 的全微分

$$dv = d\varphi,$$

因此

$$v = \varphi + C,$$

这里 $C \in \mathbb{R}$ 为任意常数, 从而有

$$f(z) = \ln \rho + i\varphi + iC = \ln z + iC.$$

再根据条件 $f(1) = 0$, 可得 $C = 0$, 因此

$$f(z) = \ln z. \quad \square$$

1.3 第 03 次课作业

习题 1.8 计算 $\operatorname{Re} z$ 沿曲线 $\ell: z = t + it^2$ ($0 \leq t \leq 1$) 的积分。

解: 首先有 $dz = (1 + 2it)dt$, $\operatorname{Re} z = t$, 从而积分为

$$\int_{\ell} \operatorname{Re} z \, ds = \int_0^1 t(1 + 2it) \, dt = \frac{1}{2} + \frac{2}{3}i. \quad \square$$

习题 1.9 (1) 已知函数 $\psi(t, x) = e^{2tx - t^2}$, 将 x 作为参数, t 为复变数, 试应用柯西积分公式将 $\frac{\partial^n \psi}{\partial t^n} \Big|_{t=0}$ 表示为回路积分。(2) 对回路积分进行变量替换 $\zeta = x - z$, 并由此证明

$$\frac{\partial^n \psi}{\partial t^n} \Big|_{t=0} = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}.$$

解: (1) 把 $\frac{\partial^n \psi}{\partial t^n} \Big|_{t=0}$ 表为回路积分如下

$$\frac{\partial^n \psi}{\partial t^n} \Big|_{t=0} = \frac{n!}{2\pi i} \oint_{\ell} \frac{e^{2\zeta x - \zeta^2}}{(\zeta - t)^{n+1}} d\zeta \Big|_{t=0} = \frac{n!}{2\pi i} \oint_{\ell} \frac{e^{2\zeta x - \zeta^2}}{\zeta^{n+1}} d\zeta.$$

(2) 将 $\zeta = x - z$ 代入上式得

$$\frac{\partial^n \psi}{\partial t^n} \Big|_{t=0} = \frac{n!}{2\pi i} \oint_{\ell} \frac{e^{x^2 - z^2}}{(x - z)^{n+1}} d(-z) = (-1)^n e^{x^2} \frac{n!}{2\pi i} \oint_{\ell} \frac{e^{-z^2}}{(z - x)^{n+1}} dz = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}. \quad \square$$

习题 1.10 计算以下积分

$$\begin{aligned} (1) & \oint_{|z|=1} \frac{dz}{\cos z}, \quad (2) \oint_{|z|=1} \frac{dz}{z^2 + 2z + 4}, \quad (3) \oint_{|z|=2} z^3 \cos z \, dz \\ (4) & \oint_{|z|=2} \frac{\sin z}{(z - \pi/2)^2} dz, \quad (5) \oint_{|z|=4} \left(\frac{4}{z+1} + \frac{3}{z+2i} \right) dz. \end{aligned}$$

解: (1) 由于被积函数 $f(z) = \frac{1}{\cos z}$ 在单位圆内解析, 利用柯西积分定理可知

$$\oint_{|z|=1} \frac{dz}{\cos z} = 0.$$

(2) 由于被积函数 $f(z) = \frac{1}{z^2 + 2z + 4}$ 在单位圆内解析, 利用柯西积分定理可知

$$\oint_{|z|=1} \frac{dz}{z^2 + 2z + 4} = 0.$$

(3) 由于被积函数 $f(z) = z^3 \cos z$ 在 $|z| \leq 2$ 内解析, 利用柯西积分定理可知

$$\oint_{|z|=2} z^3 \cos z \, dz = 0.$$

(4) 由于被积函数 $f(z) = \frac{\sin z}{(z - \pi/2)^2}$ 在 $|z| \leq 2$ 内有奇点 $\pi/2$, 利用柯西积分公式可知

$$\oint_{|z|=2} \frac{\sin z}{(z - \pi/2)^2} dz = \frac{2\pi i}{1!} \frac{d \sin z}{dz} \Big|_{z=\pi/2} = 2\pi i \cos(\pi/2) = 0.$$

(5) 由于被积函数 $f(z) = \frac{4}{z+1} + \frac{3}{z+2i}$ 在 $|z| \leq 4$ 内有奇点 $-1, -2i$, 利用柯西积分公式可知

$$\oint_{|z|=4} \left(\frac{4}{z+1} + \frac{3}{z+2i} \right) dz = \oint_{|z|=4} \frac{4}{z+1} dz + \oint_{|z|=4} \frac{3}{z+2i} dz = 14\pi i. \square$$

习题 1.11 用积分

$$\oint_{|z|=1} \frac{dz}{z+2},$$

计算积分

$$\int_0^\pi \frac{1+2\cos\theta}{5+4\cos\theta} d\theta.$$

解: 由于被积函数 $f(z) = \frac{1}{z+2}$ 在单位圆内解析, 利用柯西积分定理可知

$$\oint_{|z|=1} \frac{dz}{z+2} = 0.$$

令 $z = \cos\theta + i\sin\theta$, $0 \leq \theta \leq 2\pi$, 可得

$$\begin{aligned} \oint_{|z|=1} \frac{dz}{z+2} &= \int_0^{2\pi} \frac{-\sin\theta + i\cos\theta}{\cos\theta + i\sin\theta + 2} d\theta = \int_0^{2\pi} \frac{(-\sin\theta + i\cos\theta)(2 + \cos\theta - i\sin\theta)}{5 + 4\cos\theta} d\theta \\ &= \int_0^{2\pi} \frac{-2\sin\theta + i(1+2\cos\theta)}{5+4\cos\theta} d\theta = \int_0^{2\pi} \frac{-2\sin\theta}{5+4\cos\theta} d\theta + i \int_0^{2\pi} \frac{1+2\cos\theta}{5+4\cos\theta} d\theta. \end{aligned}$$

所以积分

$$\int_0^{2\pi} \frac{1+2\cos\theta}{5+4\cos\theta} d\theta = 0.$$

注意到被积函数是 2π 周期的, 且为偶函数, 所以

$$\int_0^\pi \frac{1+2\cos\theta}{5+4\cos\theta} d\theta = \frac{1}{2} \int_0^{2\pi} \frac{1+2\cos\theta}{5+4\cos\theta} d\theta = 0. \square$$

习题 1.12 求下列幂级数的收敛圆

$$\begin{aligned} (1) \sum_{k=1}^{\infty} \frac{1}{k} (z-i)^k, \quad (2) \sum_{k=1}^{\infty} k^{\ln k} (z-2)^k, \\ (3) \sum_{k=1}^{\infty} k! \left(\frac{z}{k}\right)^k, \quad (4) \sum_{k=1}^{\infty} k^k (z-3)^k. \end{aligned}$$

解: (1) 收敛半径为

$$R = \lim_{k \rightarrow \infty} \left| \frac{a_k}{a_{k+1}} \right| = \lim_{k \rightarrow \infty} \left| \frac{1/k}{1/(k+1)} \right| = \lim_{k \rightarrow \infty} \left| \frac{k+1}{k} \right| = 1.$$

以上极限存在, 所以收敛圆为 $|z - i| < 1$.

(2) 收敛半径为

$$R = \lim_{k \rightarrow \infty} \frac{1}{\sqrt[k]{|a_k|}} = \lim_{k \rightarrow \infty} k^{-\frac{\ln k}{k}} = \lim_{k \rightarrow \infty} e^{-\frac{(\ln k)^2}{k}} = 1.$$

以上极限存在, 所以收敛圆为 $|z - 2| < 1$.

(3) 收敛半径为

$$R = \lim_{k \rightarrow \infty} \left| \frac{a_k}{a_{k+1}} \right| = \lim_{k \rightarrow \infty} \left| \frac{k!(k+1)^{k+1}}{k^k(k+1)!} \right| = \lim_{k \rightarrow \infty} \left(1 + \frac{1}{k} \right)^k = e.$$

以上极限存在, 所以收敛圆为 $|z| < e$.

(4) 收敛半径为

$$R = \lim_{k \rightarrow \infty} \frac{1}{\sqrt[k]{|a_k|}} = \lim_{k \rightarrow \infty} \frac{1}{\sqrt[k]{|k^k|}} = \lim_{k \rightarrow \infty} \frac{1}{k} = 0.$$

以上极限存在, 所以收敛圆为 $|z - 3| = 0$, 只要 $z \neq 3$ 幂级数就发散。□

习题 1.13 在指定点 z_0 的邻域上将下列函数展开为泰勒级数 (不必给出收敛半径)

$$(1) \sqrt[3]{z}, z_0 = i, \quad (2) \ln(1 + e^z), z_0 = 0, \quad (3) \int_0^z \frac{\sin \xi}{\xi} d\xi, z_0 = 0,$$

$$(4) \frac{1}{z^2}, z_0 = -1, \quad (5) \sin^2 z, z_0 = 0, \quad (6) \frac{2}{z^2 - 4z + 3}, z_0 = 2.$$

解: (1) $\sqrt[3]{z}$ 在 $z_0 = i$ 处展开为泰勒级数

$$\sqrt[3]{z} = \sqrt[3]{(z - i) + i} = i^{\frac{1}{3}}(1 - i(z - i))^{\frac{1}{3}} = i^{\frac{1}{3}} \left(1 + \sum_{k=1}^{\infty} \frac{\prod_{l=0}^{k-1} (\frac{1}{3} - l)}{k!} (-i)^k (z - i)^k \right).$$

注: $\sqrt[3]{z}$ 是多值函数, 这里只考虑其单值分支。

(2) 解法 1: 注意到

$$\begin{aligned} \ln(1 + e^z) &= e^z - \frac{e^{2z}}{2} + \frac{e^{3z}}{3} - \cdots + \frac{(-1)^{k+1} e^{kz}}{k} + \cdots \\ &= \left(1 - \frac{1}{2} + \frac{1}{3} + \cdots \right) + \left(z - \frac{1}{2}(2z) + \frac{1}{3}(3z) + \cdots \right) + \frac{1}{2!} \left(z^2 - \frac{1}{2}(2z)^2 + \cdots \right) + \cdots \\ &= \ln 2 + \sum_{k=1}^{\infty} \frac{(\sum_{i=1}^{\infty} (-1)^{i-1} \cdot i^{k-1})}{k!} z^k \end{aligned}$$

解法 2: 注意到 $(\ln(1 + e^z))' = \frac{e^z}{1 + e^z}$, 并且 $\frac{e^z}{1 + e^z}$ 的泰勒展开为

$$\begin{aligned} \frac{e^z}{1 + e^z} &= 1 - \frac{1}{1 + e^z} = 1 - \sum_{k=0}^{\infty} (-1)^k e^{kz} \\ &= 1 - \sum_{k=0}^{\infty} (-1)^k \left(\sum_{n=0}^{\infty} \frac{(kz)^n}{n!} \right) = - \sum_{n=0}^{\infty} \left(\sum_{k=1}^{\infty} \frac{(-1)^k \cdot k^n}{n!} \right) z^n \end{aligned}$$

从而 $\ln(1+e^z)$ 在 $z=0$ 处展开为泰勒级数:

$$\ln(1+e^z) = \ln 2 - \sum_{n=0}^{\infty} \left(\sum_{k=1}^{\infty} \frac{(-1)^k \cdot k^n}{(n+1)!} \right) z^{n+1} = \ln 2 + \sum_{n=1}^{\infty} \frac{(\sum_{k=1}^{\infty} (-1)^{k-1} \cdot k^{n-1})}{n!} z^n$$

(3) 注意到

$$\frac{\sin z}{z} = \frac{1}{z} \sum_{k=0}^{\infty} (-1)^k \frac{z^{2k+1}}{(2k+1)!} = \sum_{k=0}^{\infty} (-1)^k \frac{z^{2k}}{(2k+1)!}.$$

由于 $\lim_{z \rightarrow 0} \frac{\sin z}{z} = 1$, 则 $z=0$ 为可去奇点, 可以补充定义 $\frac{\sin z}{z}$ 在 $z=0$ 出的值, 于是上式收敛范围为 $|z| < \infty$, 符合逐项积分条件, 所以 $\int_0^z \frac{\sin \xi}{\xi} d\xi$ 在 $z_0 = i$ 处展开为泰勒级数

$$\int_0^z \frac{\sin \xi}{\xi} d\xi = \int_0^z \sum_{k=0}^{\infty} (-1)^k \frac{\xi^{2k}}{(2k+1)!} d\xi = \sum_{k=0}^{\infty} (-1)^k \int_0^z \frac{\xi^{2k}}{(2k+1)!} d\xi = \sum_{k=0}^{\infty} (-1)^k \frac{z^{2k+1}}{(2k+1)(2k+1)!}$$

(4) $\frac{1}{z^2}$ 在 $z_0 = -1$ 处展开为泰勒级数

$$\frac{1}{z^2} = ((z+1) - 1)^{-2} = 1 + \sum_{k=1}^{\infty} \frac{(k+1)!}{k!} (z+1)^k = \sum_{k=0}^{\infty} (k+1)(z+1)^k$$

(5) $\sin^2 z$ 在 $z_0 = 0$ 处展开为泰勒级数

$$\sin^2 z = \frac{1 - \cos 2z}{2} = \frac{1}{2} - \frac{1}{2} \sum_{k=0}^{\infty} (-1)^k \frac{(2z)^{2k}}{(2k)!} = \frac{1}{2} \sum_{k=1}^{\infty} (-1)^{k-1} \frac{(2z)^{2k}}{(2k)!}$$

(6) $\frac{2}{z^2-4z+3}$ 在 $z_0 = 2$ 处展开为泰勒级数

$$\begin{aligned} \frac{2}{z^2-4z+3} &= \frac{1}{z-3} - \frac{1}{z-1} = \frac{1}{(z-2)-1} - \frac{1}{(z-2)+1} \\ &= \left(-\sum_{k=0}^{\infty} (z-2)^k - \sum_{k=0}^{\infty} (-1)^k (z-2)^k \right) = \sum_{k=0}^{\infty} [-1 - (-1)^k] (z-2)^k. \quad \square \end{aligned}$$
