練習題 18.3

1. (1) 由 x, y, z 的輪換對稱性可知,

$$\text{原積分} = 3 \int_{\Sigma} z^4 dx dy, \quad \left(\text{利用極座標變換} \begin{cases} x = a \sin \theta \cos \varphi \\ y = a \sin \theta \sin \varphi \\ z = a \cos \theta \end{cases} \right)$$

$$= 3 \int_0^{2\pi} d\varphi \int_0^{\pi} a^4 \cos^4 \theta \cdot a^2 \cos \theta \sin \theta d\theta = 6a^6 \pi \int_0^{\pi} \cos^5 \theta d(\cos \theta)$$

$$= -6a^6 \pi \int_{-1}^1 t^5 dt = -12a^6 \pi \cdot \frac{1}{6} t^6 \Big|_{-1}^1 = -2a^6 \pi$$

$$(2) \text{原積分} = \int_{\Sigma} (xz, yz, x^2) \cdot \left(\frac{x}{a}, \frac{y}{a}, \frac{z}{a} \right) d\sigma = \frac{1}{a} \int_{\Sigma} z(x^2 + y^2 + x^2) d\sigma = a \int_{\Sigma} z d\sigma$$

因為 Σ 是關於 xy 平面對稱, 所以 $\int_{\Sigma} z d\sigma = 0 \Rightarrow \text{原積分} = 0$.

$$(3) \text{切向量是 } \vec{n} = \frac{1}{\sqrt{x^2 + y^2 + z^2}} (x, y, z) = \frac{1}{\sqrt{2}} \left(\frac{x}{z}, \frac{y}{z}, -1 \right)$$

$$\begin{aligned} \vec{F} &= (y-z, z-x, x-y), \text{原積分} = \int_{\Sigma} (y-z, z-x, x-y) \cdot \frac{1}{\sqrt{2}} \left(\frac{x}{z}, \frac{y}{z}, -1 \right) d\sigma \\ &= \frac{1}{\sqrt{2}} \int_{\Sigma} \left[\frac{1}{z} (xy - zx + yz - xy) + y - x \right] d\sigma = \frac{1}{\sqrt{2}} \int_{\Sigma} (y - x) d\sigma = \sqrt{2} \int_{\Sigma} (y - x) d\sigma \\ &= \sqrt{2} \left(\int_{\Sigma} y d\sigma - \int_{\Sigma} x d\sigma \right). \end{aligned}$$

因為 Σ 是關於 z 軸旋轉對稱, 所以 $\int_{\Sigma} y d\sigma = \int_{\Sigma} x d\sigma = 0 \Rightarrow \text{原積分} = 0$

$$\begin{aligned} 2. \int_{\Sigma} (y, z, x) \cdot \left(\frac{x}{R}, \frac{y}{R}, 0 \right) d\sigma &= \frac{1}{R} \int_{\Sigma} (xy - zy) d\sigma, \quad \begin{cases} x = R \cos \theta \\ y = R \sin \theta \\ z = z \end{cases} d\sigma = \sqrt{R^2 + 1} d\theta dz = R d\theta dz \\ &= \frac{1}{R} \int_0^h dz \int_0^{2\pi} (R^2 \cos \theta \sin \theta - z R \sin \theta) d\theta = 0 \end{aligned}$$

3. 取 $\vec{F} = (P, Q, 0)$, $\quad = (D_x \vec{r} \times D_y \vec{r}) dx dy$

$$\int_{\Sigma} \vec{F} \cdot d\vec{\sigma} = \int_{\Sigma} \begin{vmatrix} P & Q & 0 \\ \frac{\partial x}{\partial x} & \frac{\partial y}{\partial x} & \frac{\partial z}{\partial x} \\ \frac{\partial x}{\partial y} & \frac{\partial y}{\partial y} & \frac{\partial z}{\partial y} \end{vmatrix} dx dy = \int_D \left[P(x, y, f(x, y)) \frac{\partial f}{\partial x} - Q(x, y, f(x, y)) \frac{\partial f}{\partial y} \right] dx dy$$

取 $Q=0$, 則可得 (1) 式
取 $P=0$, 則可得 (2) 式

練習 18.4

1. (1) $\int_{\Sigma} x^2 dy dz + y^2 dz dx + z^2 dx dy = \iiint_{x^2+y^2+z^2 \leq R^2} (2x+2y+2z) dx dy dz = 6 \int_{x^2+y^2+z^2 \leq R^2} z d\mu = 0.$

$$\begin{aligned} & \int_{\Sigma} xy dy dz + yz dz dx + zx dx dy \\ &= \iiint_{\Omega} (y+z+x) dx dy dz \\ &= \iint_{x+y \leq 1} dx dy \int_0^{1-x-y} (y+z+x) dz = \iint_{x+y \leq 1} \left[(x+y)(1-x-y) + \frac{1}{2} (1-x-y)^2 \right] dx dy \\ &= \iint_{x+y \leq 1} (1-x-y) \left(\frac{1}{2} + \frac{x}{2} + \frac{y}{2} \right) dx dy = \frac{1}{2} \iint_{x+y \leq 1} [1 - (x+y)^2] dx dy \\ &= \frac{1}{2} \int_0^1 dy \int_0^{1-y} [1 - (x+y)^2] dx = \frac{1}{2} \int_0^1 \left((1-y) - \frac{1}{3} [1-y^3] \right) dy = \frac{1}{2} \int_0^1 \left(\frac{2}{3} - y + \frac{1}{3} y^3 \right) dy \\ &= \frac{1}{2} \times \left(\frac{2}{3} - \frac{1}{2} + \frac{1}{12} \right) = \frac{1}{8} \end{aligned}$$

$$(3) \iint_{\Sigma} (x-y) dy dz + (y-z) dz dx + (z-x) dx dy = 3 \iiint_{x^2+y^2 \leq z \leq 1} dx dy dz$$

$$= 3 \int_0^1 dz \int_{x^2+y^2 \leq z} dx dy = 3\pi \int_0^1 z dz = \frac{3}{2}\pi$$

$$(4) \iint_{\Sigma} x^2 dy dz + y^2 dz dx + z^2 dx dy = 2 \iiint_{0 \leq x^2+y^2 \leq z^2 \leq 1} (x+y+z) dx dy dz$$

$$= 2 \int_0^1 dz \int_{x^2+y^2 \leq z^2} (x+y+z) dx dy = 2 \int_0^1 z \cdot \pi z^2 dz = \frac{\pi}{2}$$

$$2. \int_{\partial\Omega} \cos(\vec{e}, \vec{n}) d\sigma = \int_{\partial\Omega} \frac{\vec{e}}{\|\vec{e}\|} \cdot \vec{n} d\sigma = \frac{1}{\|\vec{e}\|} \int_{\partial\Omega} \left(\frac{\partial a}{\partial x} + \frac{\partial b}{\partial y} + \frac{\partial c}{\partial z} \right) d\mu \quad (\text{設 } \vec{e} = (a, b, c))$$

$$= \frac{1}{\|\vec{e}\|} \int_{\Omega} 0 d\mu = 0.$$
