

第二章补充题参考答案

7. (补充题 1) 设质量为 μ 、能量为 E 的粒子从左入射下列势垒,

$$V(x) = \begin{cases} 0, & x < 0, \\ V_0, & x > 0, \quad (V_0 > 0). \end{cases}$$

求 (1) $E > V_0$ 时的透射概率和反射概率; (2) 讨论 $0 < E < V_0$ 时粒子的透射和反射.

【解答】(1) $E > V_0$

$$\text{令 } k = \sqrt{\frac{2\mu E}{\hbar^2}}, \quad \alpha = \sqrt{\frac{2\mu(E - V_0)}{\hbar^2}}$$

定态方程为

$$\begin{cases} \frac{d^2\psi(x)}{dx^2} + k^2\psi(x) = 0, & x < 0 \\ \frac{d^2\psi(x)}{dx^2} + \alpha^2\psi(x) = 0, & x > 0 \end{cases}$$

其解为

$$\begin{cases} \psi_1(x) = e^{ikx} + Be^{-ikx}, & x < 0 \\ \psi_2(x) = Ae^{i\alpha x}, & x > 0 \end{cases}$$

由边界条件 $\psi_1(0) = \psi_2(0)$, $\psi_1'(0) = \psi_2'(0)$, 得

$$1 + B = A, \quad k(1 - B) = A\alpha$$

由上式解得

$$A = \frac{2k}{k + \alpha}, \quad B = \frac{k - \alpha}{k + \alpha}$$
$$R = |B|^2 = \frac{(k - \alpha)^2}{(k + \alpha)^2}, \quad T = 1 - R = \frac{4k\alpha}{(k + \alpha)^2}$$

应该注意的是, 透射概率 $T \neq |A|^2 = 4k^2 / (k + \alpha)^2$. 这是因为透射波波数 α 不等于入射波波数 k .

(2) $0 < E < V_0$

$$\text{令 } \beta = \sqrt{\frac{2\mu(V_0 - E)}{\hbar^2}}$$

定态方程为

$$\begin{cases} \frac{d^2\psi(x)}{dx^2} + k^2\psi(x) = 0, & x < 0 \\ \frac{d^2\psi(x)}{dx^2} - \beta^2\psi(x) = 0, & x > 0 \end{cases}$$

其解为

$$\begin{cases} \psi_1(x) = e^{ikx} + Be^{-ikx}, & x < 0 \\ \psi_2(x) = Ae^{-\beta x}, & x > 0 \end{cases}$$

由边界条件 $\psi_1(0) = \psi_2(0)$, $\psi_1'(0) = \psi_2'(0)$, 得

$$1 + B = A, \quad A\beta = ik(B - 1)$$

解之得

$$A = \frac{2}{1 + i(\beta/k)}, \quad B = \frac{1 - i(\beta/k)}{1 + i(\beta/k)}$$

$$R = |B|^2 = 1, \quad T = 1 - R = 0$$

8. (补充题 2) 谐振子问题

(1) 考虑一质量为 m 的粒子在二维势场 $V(x, y) = \frac{1}{2}m\omega^2(x^2 + y^2)$ 中运动, 求粒子的能级及能量本征波函数, 并给出能级的简并度;

(2) 若粒子所处的二维势场为 $V(x, y) = \frac{1}{2}m\omega^2(x^2 + xy + y^2)$, 求粒子的能级及简并度.

[提示: 进行坐标变换 $u = (x + y)/\sqrt{2}$, $v = (x - y)/\sqrt{2}$. 线性谐振子的能量本征函数 $\psi_n(x)$ ($n = 0, 1, 2, \dots$) 可作为已知.]

【解答】方法: 分离变量法

(1) 粒子的哈密顿量算符

$$\begin{aligned}\hat{H} &= -\frac{\hbar^2}{2m} \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) + \frac{1}{2} m \omega^2 x^2 + \frac{1}{2} m \omega^2 y^2 \\ &= \left(-\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} + \frac{1}{2} m \omega^2 x^2 \right) + \left(-\frac{\hbar^2}{2m} \frac{\partial^2}{\partial y^2} + \frac{1}{2} m \omega^2 y^2 \right) \\ &= H_x + H_y\end{aligned}$$

能量本征方程为: $\hat{H}\Phi(x, y) = E\Phi(x, y)$

利用分离变量法, 设 $\Phi(x, y) = \psi(x)\psi(y)$, 可得:

$$\begin{cases} \hat{H}_x \psi(x) = E_x \psi(x) \\ \hat{H}_y \psi(y) = E_y \psi(y) \end{cases}$$

直接利用一维谐振子的结果, 可得:

$$\begin{cases} E_x = E_n = (n + \frac{1}{2})\hbar\omega, \quad n = 0, 1, 2, \dots, \quad \psi(x) = \psi_n(x) \\ E_y = E_m = (m + \frac{1}{2})\hbar\omega, \quad m = 0, 1, 2, \dots, \quad \psi(y) = \psi_m(y) \end{cases}$$

其中 $\psi_n(x), \psi_m(y)$ 均为厄密函数.

所以, 粒子的能级为

$$E_N = E_{nm} = (N+1)\hbar\omega, \quad N = n+m, \quad n, m, N = 0, 1, 2, \dots,$$

能量本征函数为: $\Phi_{nm}(x, y) = \psi_n(x)\psi_m(y)$

能级简并度: 对于给定的 N ,

$$\begin{cases} n = 0, & 1, & 2, & \dots, N-1, N \\ m = N, & N-1, & N-2, & \dots, & 1, & 0 \end{cases}$$

所以 $f_N = N+1$

(2) 令 $u = (x+y)/\sqrt{2}$, $v = (x-y)/\sqrt{2}$, 于是有

$$x = (u+v)/\sqrt{2}, \quad y = (u-v)/\sqrt{2},$$

所以

$$\begin{aligned}\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} &= \frac{\partial^2}{\partial u^2} + \frac{\partial^2}{\partial v^2}, \quad x^2 + xy + y^2 = \frac{1}{2}(3u^2 + v^2), \\ \hat{H} &= -\frac{\hbar^2}{2m} \left(\frac{\partial^2}{\partial u^2} + \frac{\partial^2}{\partial v^2} \right) + \frac{1}{2} m \omega_1^2 u^2 + \frac{1}{2} m \omega_2^2 v^2, \quad \omega_1 = \sqrt{\frac{3}{2}}\omega, \quad \omega_2 = \sqrt{\frac{1}{2}}\omega.\end{aligned}$$

采用分离变量法, 并利用一维线性谐振子的结果, 可得:

$$\begin{cases} E_{m,n} = \left(m + \frac{1}{2} \right) \hbar \omega_1 + \left(n + \frac{1}{2} \right) \hbar \omega_2, \quad (m, n = 0, 1, 2, \dots) \\ \psi_{m,n}(x, y) = \psi_m(u) \psi_n(v) \\ \psi_{m,n}(x, y) = \psi_m(u) \psi_n(v). \end{cases}$$
